#### POPULATION AND MANPOWER OF INDOCHINA\*

#### I. Introduction.

Indochina is settled most heavily along the coast and in the river valleys. These valleys are isolated from one another by mountain ranges. Much of the large expanse of the country is sparsely settled. In 1949, only about 14 percent of the land in Vietnam was cultivated. As a result, the density per square mile of cultivated land in sections of the Red River delta and Central Vietnam was over 1,700, about as high as that of any nonurban area in the world. On the other hand, Cambodia had only 47 people per square mile (total) and Laos, only 14.

The overpopulation of North and Central Vietnam, where land resources are crowded, and the relative underpopulation of Laos and Cambodia have made for underemployment in North Indochina and shortage of labor in South Indochina, where European projects have been most numerous. French capital investment has been for the most part concentrated on the production of agricultural and mineral raw materials. The typical colonial economy of production of low-priced raw materials and consumption of higher priced consumer goods developed.

After the depression of the 1930's, some recognition was given by France to the need for increasing purchasing power by industrialization. The 1938 program for economic development, however, excluded any provision for local development of the manufacture of metals, machinery, textiles, and chemicals and concentrated on light consumer industries, especially the development of handicrafts. A second plan adopted in 1947 provided for limited small-scale development of industry and for public works, but the spread of hostilities prevented its implementation.

The Indochinese are a heterogeneous people with little concept of unified nationality. The Annamites, long under the influence of the Chinese, are the most culturally advanced. There are also numerous

<sup>\*</sup> The estimates and conclusions contained in this memorandum represent the best judgment of the responsible analyst as of 21 July 1954.

#### <u>S-E-C-R-E-T</u>

groups which retain their primitive culture. This heterogeneity has been perpetuated by the natural barriers isolating the various regions and by the French policy of dealing with individual republics rather than with the country as a whole.

The divisions between factions have been intensified by events of the past decade. In March 1945, when the Japanese replaced the French, Bao Dai became emperor of Annam and Ho Chi Minh organized the Republic of Vietnam in exile in China. In August 1945 the Japanese were replaced by a Viet Minh Revolutionary Committee. During this period the British occupied the southern portion and the Chinese Nationalists the northern portion of the country. Early in 1946 the French regained some of their influence by taking over the British areas and by arranging to replace the Chinese Nationalists in the north. A con vention with Ho Chi Minh recognized the republic of Vietnam as a free member of the French Union. The outbreak of the present hostilities began late in 1946, when the French bombarded Haiphon because of the activities of Viet Minh smugglers and when cease-fire negotiations proposed by Ho broke down.

## II. Population and Labor Force.

The total population of Indochina in 1954 is estimated at 30.5 million, with 25.0 million people estimated to be in Vietnam. This estimate, as shown in Table 1,\* and other population estimates in this memorandum are subject to a probability of at least 10 percent error (see the footnotes to Table 1). It is estimated that in Vietnam 14.0 million people are living north of the 17th Parallel in what is now under Communist control, and 11.0 million south. Tables 2 through 7\*\* give local provincial estimates permitting any grouping desired.

Age and sex distributions are not available from published statistics, but other Asian countries with similarly high birth and death rates have about 40 percent of their population below 15 years of age, about 3 percent over 60, and about 57 percent between 15 and 59. There are probably 7 million males of military age (15-59). 1/\*\*\* Probably 4 million of these males are in territory under Viet Minh control and 3 million under Vietnam control.

<sup>\*</sup> Table 1 follows on p. 5.

<sup>\*\*</sup> Tables 2 through 7 follow on pp. 5 through 12, respectively.

\*\*\* Footnote references in arabic numerals are to sources listed in the Appendix.

#### S-E-C-R-E-T

If the ethnic groups are divided as they were in 19 $\frac{1}{2}$ 3, about half of the 20 million Annamites live on each side of the 17th Parallel. Most of the 3.2 million Cambodians live in the south, as do most of the 1.4 million Thai and Laotians. There are about 300,000 primitive tribesmen in the north, and about 1 million such primitives in the south. The 66,000 French are mostly in the south.  $\frac{2}{}$ 

By far the largest alien group is the 600,000 Chinese, 500,000 of whom live in the south. The majority are second- and third-generation Chinese who were born in Indochina but who have retained their Chinese culture and community organization. 3/ As usual in Asian countries, these alien Chinese exert an influence on the trade and finance of the country greatly disproportionate to their numbers.

The urban population of Indochina, as shown in Table 8,\* is divided so that about 2 million people live south of the 17th Parallel and 760,000 live to the north. The cities have grown rapidly because of the unsettled conditions in the outlying areas. About 1.6 million of this urban population are in the Saigon-Cholon community.

On the basis of the small urban population it would appear that from 85 percent to 90 percent of the people are dependent on agriculture, and it is probable that less than 750,000 have even the most tenuous connection with nonagricultural employment at any time during the year. Recent census enumerations of Burmese cities in which conditions are believed to be roughly comparable 4/ indicate that all but a handful of the nonagricultural employees work intermittently at household handicrafts and small mercantile ventures, earning the equivalent of from US \$30 to US \$50 per year.

In prewar Indochina there were a few thousand people employed in transportation, mining, and cement and textile manufacture. At present, most of the mining and transport facilities are shut down or operate only sporadically. An attempt to allocate employees by region would therefore be of little significance.

The meager facilities for training skilled workers are shown in Table 9.\*\* In 1948, only 1,300 students were enrolled in vocational and apprentice courses, and about 1,000 of these were in schools south of the 17th Parallel. The present condition of these schools is unknown.

<sup>\*</sup> Table 8 follows on p. 13.

<sup>\*\*</sup> Table 9 follows on p. 14.

#### S-E-C-R-E-T

#### III. Deficiencies in the Data.

The data in this report are probably subject to frequent and large errors. The estimates of the populations of North, Central, and South Vietnam for 1954 are based on official Vietnamese sources, reporting for 1952. The estimates of the provincial populations have the dubious virtue of being based on the 1943 distributions in the various regions. It seems likely that all estimates for the provincial populations, including those in this report as well as those for 1943 and for 1952 by official sources, are highly unreliable. They would seem subject to errors in the counting of people introduced (1) through the interest of local populations in avoiding the military draft and in avoiding payment of high taxes, and (2) through the erratic guesses of local officials in reporting, on the basis of inexpensive and rapid examination of their records, to central headquarters in Saigon. The virtues of the 1943 estimates are that provincial estimates are complete for all provinces (whereas those for 1952 in official sources were incomplete) and that the errors may possibly not have been quite as extreme in 1943 as in 1952. The discussions of specific errors and the presentation of methods used in deriving the data are placed in the footnotes to appropriate tables.

S-E-C-R-E-T

S-E-C-R-E-T

Table 2

Estimated Population of North Vietnam, by Province 7/
1954 a/
(Continued)

- a. Provincial population is calculated on the assumption that the population of North Vietnam increased at a slower rate, 1943 to 1954, than the populations of Central and South Vietnam. The rate of increase accepted for North Vietnam is 7.6 percent, while Central and South Vietnam are assumed to have increased at 12.5 percent for the same period. The rate of increase for the total population of Vietnam is estimated at about 11 percent for the period 1943-54, or an average of one percent per year. 8/ The 1954 estimates of urban population are based on the official 1952 estimates for Hanoi, Haiphong, and Hoanlong. The provincial populations (excluding cities) for 1954 were therefore calculated on the basis of a 7.6 percent increase of the provincial population as distributed in 1943.

  b. Map key numbers refer to map, Indochina: Administrative Divisions, following p. 17.
- c. The 1943 Bac Ninh Province had by 1952 been split into two new provinces: Bac Ninh and Gia Lam. The population of the new Bac Ninh Province was given in official Vietnam 1952 reports as 288,000 and that of Gia Lam as 224,000. 9/ The total reported by official Vietnam sources, for the old area was therefore 512,000 in 1952. Since the estimate of this report is 562,000 for 1954, the population of the 2 new provinces was calculated by applying the percentage distribution which was calculated from the figures in the official reports.

  d. Hai Duong Province by 1951 had been separated into 2 new provinces: Hai Duong and Vinh Ninh (map key No. 25). The population of Hai Duong was officially reported to be 450,000 in 1951, and that for Vinh Ninh to be 379,000. The official Vietnam total for the old Hai Duong area would be 829,000. Since the estimate of this report for 1954 is 873,000 for the old area, the populations of the 2 new provinces was calculated
- figures in the official reports.
  e. Suburb of Hanoi.

by applying the percentage distribution which was calculated from the

|  | Total Estimated Population of South Vietnam  | 6,300,465  |

a. Map key numbers refer to map following p. 17.

b. The distribution of the 1954 population in the rural provinces (not including that in the Saigon-Cholon and Poulo-Condo cities) was derived on the basis of the distribution of the 1943 population, excluding the population of cities. By excluding this segment of the population, 1954 population estimates for the rural provinces were obtained which are about 7.4 percent below the corresponding 1943

S-E-C-R-E-T

Table 3

Estimated Population of South-Vietnam, by Province 10/1954 (Continued)

estimates. This follows from the fact that, while the total population of South Vietnam increased by apparently only 12.5 percent from 1943 to 1954, the population of the Saigon-Cholon urban area, in tripling, expanded from only about 9 percent of the total population of South Vietnam in 1943 to about 25 percent in 1954. Undoubtedly internal disorder may have created falling rates of increase in the rural provinces. It is difficult, however, to argue that this disorder was worse than in North and Central Vietnam. Furthermore the 1954 population of Saigon now includes about 500,000 Chinese, many of whom arrived as refugees during and following World war II. 11/ Finally opportunities for industrial employment have increased but little since 1943.

Since South Vietnam is the rich rice bowl of Vietnam, it seems possible that the true population of South Vietnam may actually be as much as a million larger than the total given in this report. This possibility would involve an estimate of an increase of 12.5 percent in the population of the rural provinces of South Vietnam and a total increase for South Vietnam of about 30 percent. This increase would represent a continuation of the trend reported from 1936 to 1943 for South Vietnam. 12/
